

Lyssy & Eckel Mule Deer Feeds...

At Lyssy & Eckel we are serious about producing mule deer feeds that will maximize your deer herd's genetic potential. Deer nutrition is a complex issue and our feeds are based on extensive whitetail research and almost a decade of mule deer research. We have learned that mule deer are quite different from whitetails. Digestion rates are slower, nutrient absorption is reduced and requirements for browse are much greater. Negative effects of the rut and harsher weather conditions are more traumatic and post-rut recovery is slower, just to mention a few of the differences. Our mule deer feeds are formulated to compensate for these problems. We have worked on mule deer formulations for several years now and the results have been outstanding!!!

Our mule deer feeds are formulated to create maximum antler growth through accelerated blood flow. Our feeds feature high levels of calcium, phosphorus and magnesium, which are essential for antler development. Additionally, elevated levels of copper, zinc and manganese along with Vitamins A, D and B-Complex are provided to nourish the cells that build antlers. Multiple sources of protein are known to improve protein absorption. Our feeds are formulated with nine sources of proteins and carbohydrates that are matched to optimize

rumen fermentation. When you buy Lyssy & Eckel Feeds, you can be assured that you are purchasing a feed that is based on many years of experience. Our record of producing trophy mule deer assures you that when you feed Lyssy & Eckel Feeds, you will maximize your mule deer's genetic potential. Yes, genetics and age are critical, but the key to maximizing genetic potential is a proven feed.
