

Devine Little Burr Medic

(little burr clover)

Devine™ Little Burr Medic (little burr clover) is a selection of naturalized little burr medic, developed by Dr. William R. Ocumpaugh of the TAES-Beeville and released by Texas Agricultural Experiment Station. It is produced and distributed through Pogue Agri Partners, Inc., Kenedy, TX. Devine™ originated from a kleingrass pasture near Devine, Texas.

Description: Devine™ has been extensively tested. Results indicate that it will yield as much or more than other medics in the region from just south of San Antonio to north of Stephenville and west to San Angelo. In this I-35 corridor and western area no other medic will consistently produce as much dry matter as Devine™. Devine™ will persist from season to season due to its excellent seed production and a very high hard seed content. Devine™ has better winter hardiness than any other burr medic currently used in this area.

If allowed to seed it will re-establish itself naturally for years provided the pasture is properly managed for legumes. Devine™ will maintain very high quality forage with 30% crude protein through March. Devine™ is readily consumed by most classes of livestock as well as most classes of wildlife and exotics. Most medics, including Devine™ prefer a soil pH above 6.5, and will perform well on sites with a pH into the 8-range.
