

Natsu Grass (*Panicum maximum*)

New, very high producing forage. Has the potential to yield up to ten tons of dry matter per acre and has excellent regrowth.

Crude protein has tested from ten to twenty percent and total digestive nutrients from 60 to 78 percent.

Cold and drought tolerance are limited. To best manage Natsu Grass, allow some seed to shatter each year, then disc in early Spring to produce a new crop year after year.

Performs extremely well under irrigation.
